Creating a vegetated surface where soil has been highly disturbed or completely destroyed requires defining the current status of the site, developing the characteristics for the final site, inventorying and testing the soil and related materials available, who will do the work and their abilities, and identifying any limitations or barriers to project completion. The following information is needed to understand the project and develop the recommendations.

Current Site Status

location or directions: _____

size: acres _____ elevation change _____ acres to be vegetated _____

describe the condition or objectives the cover is to provide

describe the site as it exists (photos, topographic maps, etc are useful)

describe any problem areas such as poor drainage, access limitations, and local restrictions
